

Anti-tack for Compounds

PROMOL 1264C

PROMOL 1264C is a white, water-dispersible powder, which is used in the rubber industry to avoid surface sticking of unvulcanized rubber compounds. Because of the very good separating effect also with soft and cold-flowing compounds and the good stability of the ready-to-use dispersion, PROMOL 1264C provides an easy, economical and fairly clean method of working in the millroom.

The product offers numerous advantages:

- the product does not leave any hard particles on equipment
- very safe to be used on thin butyl air inner liner, no particles which have to be distributed
- very good separation, also on demanding uncurved rubber compounds
- the film can avoid any stickiness of compound even during long periods of storage
- it is suitable for cold flowing compounds

AVAILABLE PACKAGING

DESCRIPTION	NET QUANTITY
FIBCs	200 – 1.250 kg
Paper bags	20 kg
Water-soluble bags	10 kg
